

Bactair 245 UVC Air Purifier

The system that destroys airborne bacteria and viruses by exposure to UVC light source.

UVC radiation destroys the DNA in all living matter, but because the light source is shielded from human view the system is perfectly safe.

An accredited Laboratory has tested our larger systems and the results are impressive. The system can be tailored to suit special applications; air-conditioning systems is an ideal application. Especially where recycled air is used, for example Airlines Capable of 12 air changes per day in a room 3 metres X 4 metres X 3 metres

Lightweight
Powder Coated Aluminium

Similar systems are currently being used successfully in many applications including Bristol Water, Oxford University and the Blood Bank.

Employees and travellers will soon be insisting that their health is protected by upper air UVC irradiation.
